RESEARCH STUDY

Increasing Cooperation of Children with Intellectual and Developmental Disabilities to Dental Procedures

Does your child have problem behavior at the dentist's office, such as crying, self-injury, or aggression?

Does your child have a hard time cooperating with routine dental procedures?

Are you interested in increasing your child's cooperation at the dentist's office?

Dr. Iser DeLeon and Izzy Schieber are recruiting participants for studies to teach children with developmental disabilities to cooperate with dental procedures.

The purpose of the study is to help children cooperate during dental exams through an in-home, caregiver-led intervention and clinical procedures when needed.
